PROFESSIONAL SUMMARY

Software Engineering graduate with 8 months of hands-on software engineering experience building enterprise applications and full-stack systems. Experienced in Java/Quarkus and TypeScript/Node.js for backend development, with React and Next.js for frontend applications. Built REST APIs, microservices, event-driven systems, and production-oriented applications using Kafka, Redis, Docker, CI/CD, and Azure. Strong interest in full-stack engineering, backend architecture, and building reliable, scalable software.

PROFESSIONAL EXPERIENCE

Datasabai Thailand — Software Engineer Intern **Dec 2025 – Jul 2026**

- Engineered custom EDI (EDIFACT/X12) and SAP IDoc (WE60) parsers using Java and Quarkus to automate enterprise data transformation and mapping, replacing a manual integration workflow and reducing the effort required to configure new integrations.
- Developed Changelog Composer, an AI-powered release automation tool that transforms pull-request data into audience-specific changelog notes for Dev, QA, and User views, reducing repetitive manual work in release documentation.
- Extended the company's VS Code extension with a React Flow-based visual workflow editor, enabling drag-and-drop workflow authoring and improving workflow visualization and usability for developers.
- Implemented CI/CD and containerized deployments using GitHub Actions, Azure DevOps, Docker, and Azure VM, adding automated health checks and rollback support to improve deployment reliability and recovery from failed releases.

FEATURED PROJECTS

J Track — Job Tracking Platform

- Designed and developed a microservices platform using TypeScript and Express.js with Kafka-based event-driven communication and the Transactional Outbox Pattern, ensuring reliable coordination between database transactions and event publishing.
- Implemented idempotent consumers, retry mechanisms, Dead Letter Queue (DLQ) handling, and DLQ replay to prevent duplicate processing and enable reliable recovery from failed event processing.
- Containerized services with Docker and implemented CI/CD using GitHub Actions, with automated Azure VM deployments and NGINX as a reverse proxy, improving deployment consistency and reducing manual deployment steps.
- Improved API performance and resilience using Redis caching and rate limiting, while integrating AI-based job matching to improve job discovery.

EduPro — Multi-Tenant E-Learning SaaS

- Developed a multi-tenant SaaS platform using a service-oriented architecture with strict tenant-level data isolation, preventing cross-tenant data access while supporting multiple organizations on a shared platform.
- Implemented asynchronous AI learning roadmap generation using QStash orchestration, idempotent job processing, deterministic fallbacks, and Redis-backed concurrency controls for reliable long-running workflows.
- Built automated unit, integration, and Playwright E2E tests covering critical workflows to detect regressions and improve release confidence.
- Designed reliable course-to-certificate workflows and automated deployment processes focused on application reliability and consistent releases.

workflow-mcp — Visual AI Workflow Builder

- Engineered a visual workflow builder using React Flow with multi-agent pipelines, conditional branching, variable chaining, HTTP requests, and real-time SSE streaming, enabling users to construct and monitor complex AI workflows.
- Designed a DAG execution engine using topological sorting and QStash orchestration, with Redis-based cancellation, encrypted credentials, and dynamic tool injection for controlled execution of long-running workflows.

EDUCATION

Mae Fah Luang University **2022 – 2026**

Bachelor of Engineering in Software Engineering **GPA: 3.79/4.00**

TECHINICAL SKILLS

Languages: Java, TypeScript, JavaScript, SQL
Backend: Quarkus, Node.js, Express.js, REST APIs, Microservices
Frontend: React, Next.js, Tailwind CSS
Distributed Systems: Kafka, Event-Driven Architecture, Transactional Outbox, DLQ
Databases: PostgreSQL, MongoDB, Redis, MySQL
Cloud & DevOps: Azure, Docker, GitHub Actions, Azure DevOps, CI/CD, NGINX
Tools: Git, QStash

ADDITIONAL INFORMATION

Languages: Burmese (Native) · English (Fluent) · Thai (Basic)
