SUMMARY

Software Engineering graduate with 8 months of industry experience at Datasabai Thailand, building web applications, backend services, REST APIs, and developer tools. Experienced with TypeScript, Node.js, Express.js, Java, Quarkus, PostgreSQL, Redis, Docker, and CI/CD. Hands-on experience with API integrations, asynchronous workflows, automated testing, production troubleshooting, and Azure deployments. Strong interest in building reliable, scalable backend systems and maintainable web applications.

EXPERIENCE

Datasabai Thailand — Software Engineer Intern **Dec 2025 – Jul 2026**

- Built Java/Quarkus tools that scrape EDI specifications (EDIFACT, X12) and parse SAP IDoc (WE60) exports into structured JSON Schema artifacts for integration.
- Built reusable SDK modules and REST API integrations using Java, Quarkus, and Maven to support application interoperability.
- Extended a React/TypeScript workflow tool with reusable components and SDK integrations, debugging issues across frontend and backend boundaries.
- Built Changelog Composer, which turns Azure DevOps pull-request and pipeline data into release notes for Developer, QA, and Business teams, replacing manual copy-paste and its APIs documentation.
- Supported Docker-based deployments and CI/CD workflows using GitHub Actions, Azure DevOps, and Azure VM.
- Collaborated with senior engineers on implementation, testing, debugging, integration, deployment, and production troubleshooting.

TECHNICAL SKILLS

- Backend: Node.js, Express.js, Java, Spring Boot, Quarkus, Kafka
- Frontend: React, Next.js, TypeScript, JavaScript, React Flow
- Databases: PostgreSQL, MySQL, Redis, MongoDB, InfluxDB
- Testing: Jest, Vitest, Playwright
- DevOps & Deployment: Docker, GitHub Actions, Azure DevOps, CI/CD, Azure VM, NGINX, Git

EDUCATION

Mae Fah Luang University 2022 – 2026
Bachelor of Engineering in Software Engineering GPA: 3.79/4.00

FEATURED PROJECTS

Energy Tracker — Event-Driven Home Energy Monitoring Platform
Java 25, Spring Boot, Spring Cloud, Apache Kafka, InfluxDB, MySQL, Redis, Spring AI, Docker, Next.js

- Built an event-driven pipeline to process energy readings, detect consumption threshold breaches, and trigger alerts, helping users identify excessive energy usage without waiting for monthly bills.
- Implemented API gateway circuit breakers and fallback responses to limit cascading failures and keep monitoring functionality independent of AI recommendation availability.
- Limited redundant AI requests and protected provider quotas with Redis caching, in-flight request deduplication, and per-user rate limiting, with streamed energy-saving recommendations.

J Track — Job Tracking Platform
TypeScript, Express.js, PostgreSQL(Neon), Redis, Kafka, Docker, GitHub Actions, Azure, NGINX

- Built REST APIs for authentication, users, jobs, and notifications with Express.js and PostgreSQL.
- Implemented Kafka asynchronous workflows using the Transactional Outbox pattern, idempotent consumers, retries, and a Dead Letter Queue to reduce lost or duplicate events.
- Used PostgreSQL transactions and Redis for reliable processing, caching, and rate limiting.
- Automated testing and deployment with Docker and GitHub Actions CI/CD to an Azure VM behind NGINX.

EduPro — Multi-Tenant E-Learning SaaS
Next.js, React, TypeScript, PostgreSQL (Neon), Prisma, Stripe, Vercel

- Developed a full-stack e-learning platform with database-backed access controls and Stripe checkout and webhook integration for payment and enrollment workflows.
- Identified and fixed cross-tenant data-access vulnerabilities to strengthen tenant isolation and protect user data.
- Built unit tests and Playwright end-to-end tests to verify critical application workflows.
